AI & Python Internship — Basics and Data Structures

This repository contains beginner-friendly Python programs prepared for Module 01: Introduction to AI & Python.

Folders

01_Basics : variables, data types, calculator, conditions, loops, factorial, prime checking, Fibonacci sequence, and grade calculation.

02_Data_Structures: lists, duplicate removal, word frequency, dictionaries, sets, and tuples.

Requirements

Python 3.10 or later recommended.

No third-party packages are required; all programs use the Python standard library.

How to run

Open a terminal in the project folder and run a file, for example:

python 01_Basics/03_even_or_odd.py

python 02_Data_Structures/03_word_frequency.py

On some Windows systems, use py instead of python.

Learning objectives

Practice variables, data types, input/output, operators, conditions, loops, and functions.

Use common Python collections: lists, dictionaries, sets, and tuples.

Practice simple validation and problem-solving.

These programs are educational exercises. Update and test them as you learn.
